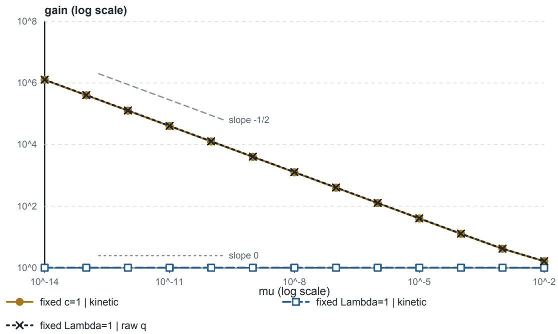
R0.73B | Bloch low-gap weights and physical kinetic transients

Analytic bounds beside validated finite N=10 diagnostics; no tail enclosure

A Low-gap gain by parameter path

[0,0.75] | combined broad + targeted grids

FINITE N=10 DIAGNOSTICS - NO GALERKIN TAIL

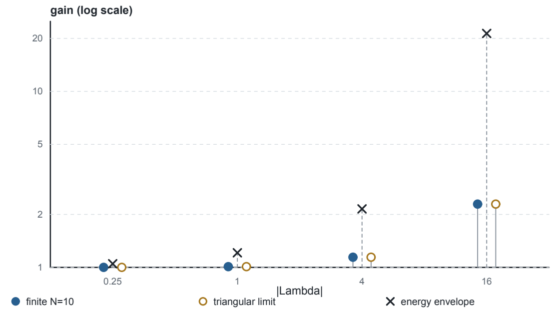


13 distinct mu per series | every point labelled FINITE N=10 in data.csv

B Finite gain, triangular limit, envelope

mu=10^-8 | [0,0.75] | physical kinetic norm

ANALYTIC ENERGY ENVELOPE - UPPER BOUND



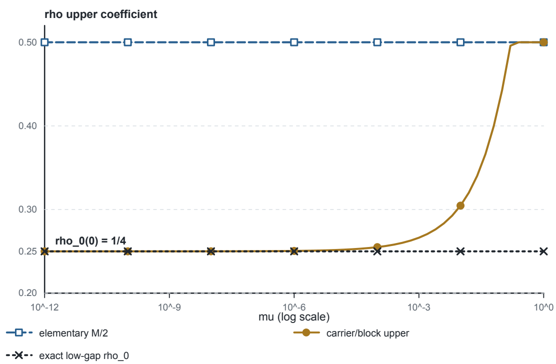
finite vs limit relative difference <= 8e-9

EXACT MAXIMUM TRANSIENT: NOT CLAIMED

C Sharp OS shear coefficient at d=0

Three analytic curves; rho_mu is not numerically truncated here

ANALYTIC ONLY - NO TRUNCATED OPERATOR NORM

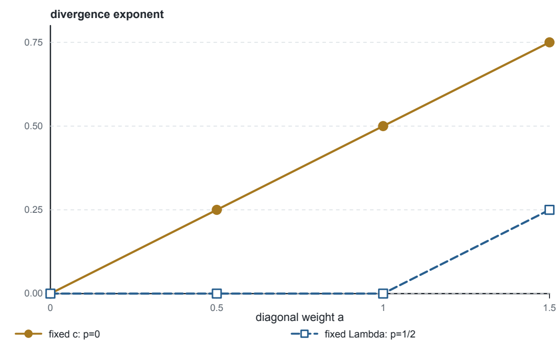


0.188106... is an integrated log coefficient, not a gain

D Weight threshold: observed vs predicted

fits on mu=10^-14...10^-11 | four audited diagonal weights

BLOCK PREDICTION (a/2-p)_+



lines: exact block prediction | markers: FINITE N=10 fits

critical fixed-Lambda weight: a=1
