

Dynamic autocorrelation: one upper estimate, two missing variables

Normalized periodic torus · exact identities and Fraction witnesses · no PDE simulation

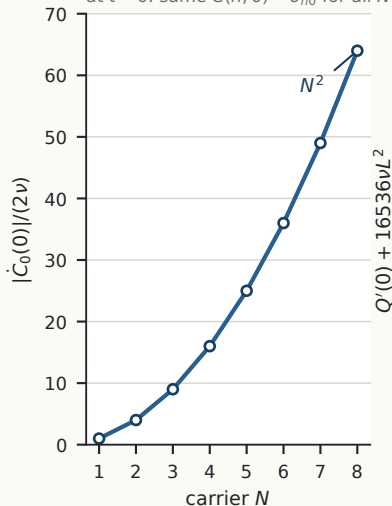

A One-sided AQ budget

exact balance → classical pressure bound → R0.73S

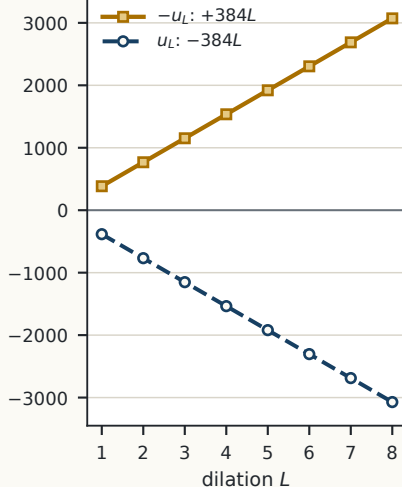

B Carrier-scale loss

at $t = 0$: same $C(h, 0) = \delta_{h0}$ for all N

C Signed pairing phase

same C at $t = 0$; viscous term removed

Boundary: $\int A dt$ is critical and $A \geq \|u\|_\infty^2$; exact scalar C is not autonomous.

Exact analytic / rational finite evidence only · smooth witnesses · not a simulation · NOT CLAY
