

R0.74I moving-tube criterion and logarithmic screen

36/36 exact finite gates; analytic implications and affine exponents only; no unknown constants plotted.

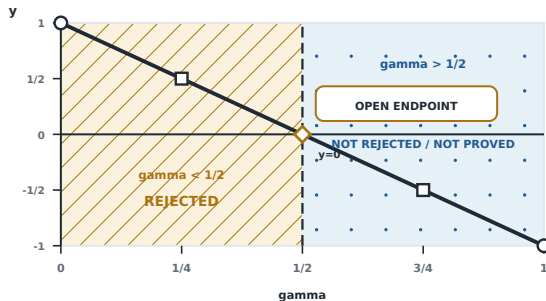

A Moving tube to a regular point

Scope: no claim that E_R is small at every point or scale.

B Exact logarithmic exponent screen

candidate residual power: $y(\gamma) = 1 - 2\gamma$

log window: $2\rho \leq \lim \log(P_j)/L_j^2 \leq 3\rho$

$\rho=1/320$; width= $1/320$; lacunarity exponent= $1/64$

Screen applies along realized lacunary P_j only.
