

Tensor heat hierarchy: pressure recovered, signed tangent still missing

Normalized periodic torus | exact identities and a four-site Fourier diagnostic | no PDE simulation

A Exact map / parity barrier

local-product tensor, not KHM covariance

$\Theta_s(-u) = \Theta_s(u)$, but odd terms change sign

B Exact witness at $h_* = (1, 2, 0)$

initial time $t=0$ | four Fourier sites | exact integers

C Universal heat profile

exact $f(z) = ze^{-5z^2}$, $z = \sqrt{s}L$

Parabolic boundary: $s = \theta L^{-2}$ gives $D_L(s) = 2\sqrt{6}\theta e^{-5\theta} s^{-1/2}$ - coefficient-level one-derivative cost at a fixed slice.

Exact analytic / finite Fourier diagnostic | coefficient-level | not a simulation or fitted law | NOT CLAY
