

Canonical best-N last exits: exact representations, no new compression

R0.74S STEP 9 | SHARP B_Q ERROR | NO-GAIN / NO-GO | NOT CLAY

A Signed F half-exit

$W_{\text{half}}^F = (1/2) S_N^F$
forced signed full tail

EXACT

$\sup_{\tau} \inf_{\{S_{\tau}\}}$
exceptions depend on terminal

ORDER

F half-exit may fail S.25
closure is not admissibility

FALSE

Cancellation remains inside the complete nonexceptional tail.

B K-theta last exit

$L_{\text{theta}} = (1-\text{theta})T$
minus Delta Q

EXACT

$|W_{\text{theta}}^K - (1-\text{theta}) S_N^K| \leq B_Q$

SHARP

$\text{theta} < 3/4$
finite good-stop closure

SCOPED

No continuity of the selector;
no infinite cutoff test.

C No-gain boundary

canonical last-exit bounds
equivalent to open best-N tails

NO-GAIN

full domain = Q.12
plateau domain is weaker

DISTINCT

NEXT: paid-branch
forced PDE residual tail

OPEN

No new quadratic compression.
Step 8 no-go and S.38 retained.
No regularity conclusion.
NOT CLAY.
