

Growing-root operator-sampling bounds

Analytic/certificate envelopes · unit phases $M = 2N + 1$ · fixed target and enstrophy floors · selected roots

A Integer-lattice payment

B Selected-root envelope laws

Source: R0.71Y analytic theorem and committed high-precision / independent certificates.

Analytic/certificate envelopes, not DNS; selected unit-phase roots with full floors only. No growing-root construction, universal endpoint, or regularity claim.

C Equal-grid conditioning squeeze
