

All-root suppression and launch retention

Analytic/certificate envelopes · real shear and unit phases · fixed target · no DNS

A Exact integer-lattice factor

dimensionless lattice factor

B Complete versus selected roots

upper envelope / common $M = 3$ value

C Observation-coupling laws

upper envelope / own $M = 3$ value

D Fixed-window retention boundary

enstrophy retention θ

Source: R0.71Z analytic theorem, high-precision certificate, and independent finite-matrix audit.

Analytic/certificate values, not DNS. Complete squared-slope mass, not raw root count; strong-coupling curve is diagnostic only.

Real-shear, fixed-target, unit-phase triangular class; launch-inclusive payment with roots on the later window. No universal endpoint or regularity claim.
