

Remote persistence gate: kinetic coercivity versus the full clock

R0.74Z | exact weight ladder | strict W-kinetic threshold | critical and full-clock branches open

A Exact remote-shell weight ladder

EXACT DYADIC WEIGHTS

same physical annulus: $A_{k_2-1}(R) = A_{k_2-2}(2R)$

CLOCK WEIGHT $\omega = \Gamma^{1/4}$ | PAYMENT WEIGHT $\omega^{1/4} = \Gamma^{1/16}$

B Strict W-kinetic persistence threshold

C Conditional persistence and necessary complexity

CONDITIONAL / NECESSARY ONLY

necessary: $\liminf_{L \rightarrow \infty} -2 \log \mathcal{N}_L \geq \frac{476239}{1064835072}$

NECESSARY, NOT SUFFICIENT | EQUALITY OPEN

D W-kinetic result versus the full clock

FAIL-CLOSED CLAIM HIERARCHY

PROVED	same-b exact family weight ladder shell-tube Holder coercivity (Z.15~Z.16)
CONDITIONAL	endpoint + Z.22 + moving-strip all-winding implies R^3 persistence
OPEN	critical $\kappa^* + o(1)$ accumulated clock rows full-clock Y57 arbitrary exponential finite family
NEXT Z.39	spectral / observability persistence-payment dichotomy must control the complete clock and payment ledger

kinetic floor is not at upper bound of completed clock κ
