

R0.46 two-block weighted-column diagnostics

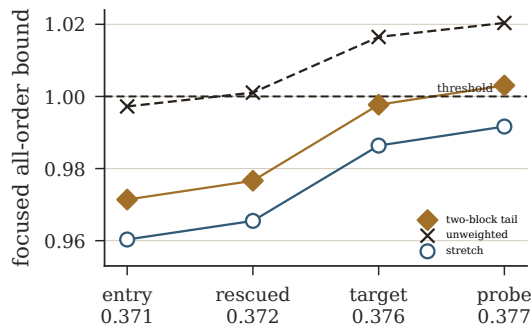

Exact GMP bounds; same-column zero/nonzero output correlation moves the certified radius from 0.371 to 0.376

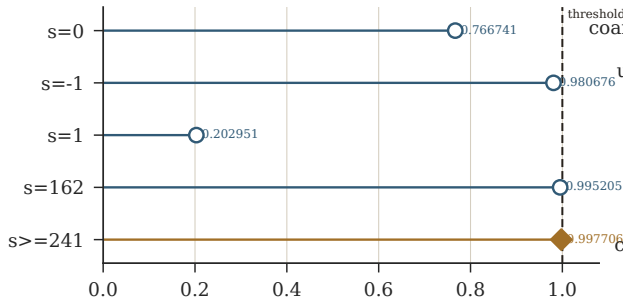

(a) Exact weight envelope at $r = 0.376$

(b) Radius controls at $\kappa = 3/4$

(c) Exhaustive sectors at $r = 0.376$

all-order weighted-column bound

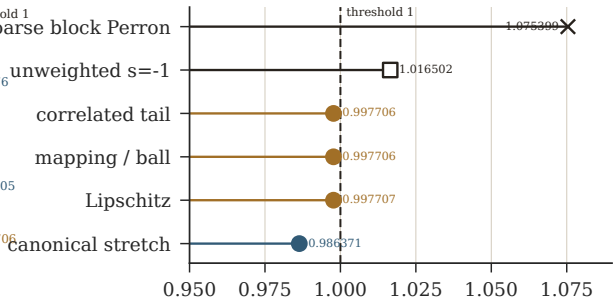

Norm: $\|f\|_{r,\kappa} = \kappa \|P_0\|_B + \|P_{\neq 0}\|_B$, with $\kappa = 3/4$; all five charge sectors are covered analytically.

Target: at $r = 0.376$, the correlated tail is 0.997706, while the unweighted $s = -1$ column is 1.016502.

Control: at $r = 0.377$, the inherited common-slope large sector is 1.003041; this is a sufficient-bound failure only.

Scope: reduced canonical edge generating system; sampled weights validate presentation, not the all-order theorem.

(d) Correlation and construction gates

focused bound; Perron value is display-only
