

All target orders at least ten form a certified contracting tail

quartic-critical amplitude · invariant shear Dyson series · $M_r = 16^r$ · one finite eighth-order gate remains

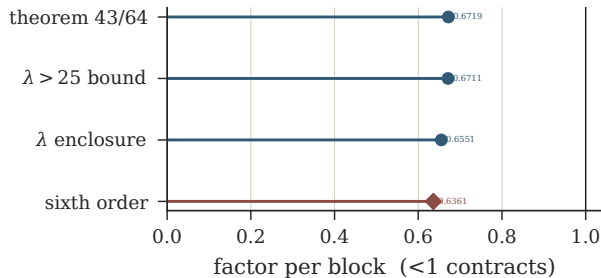

(a) Complete tail relative to the quadratic target

Claim boundary: complete ≥ 10 tail only; the eighth-order heat term and general 3D regularity remain open.

(b) One-block contraction factors

(c) Reduction of the all-order question
