

R0.47 exact charge-degree lattice diagnostics

Exact GMP bounds; preserving lattice correlation moves the certified radius from 0.376 to 0.376932

(a) Fixed-charge all-degree endpoints at $r = 0.376932$

(b) Large-charge lattice branches in $y = 1/s$

(c) Radius controls at $\kappa = 3/4$

Theorem: each fixed $2 \leq s < 241$ covers all $j \geq j_s$; the even/odd rational branches cover every $s \geq 241$.

Target: the exact $s = 162, j = 81$ column is 0.9999973491 at $r = 0.376932$; the fixed-point and stretch gates close.

Control: the same true column is 1.0000026585 at $r = 0.376933$; this is a failure of this sufficient norm inequality only.

Scope: reduced canonical edge generating system; rational-curve samples are presentation aids, not the continuous sign proof.

(d) Exhaustive sectors at $r = 0.376932$
