

One total-degree weight gives $\|\Phi(f)\| \leq 3\|f\|^2$ on $q \geq -1$; all four plotted contraction ratios are strictly below one.

The exact residual is 2.08×10^{-42} of its allowance. The 62D degree-12 inverse is a finite check; the radius theorem is all-order.

Boundary infinite-inverse bound: 3.3064. Exact rational data and hashes are archived with the figure.
