

Threshold and constraint geometry for one affine charge weight

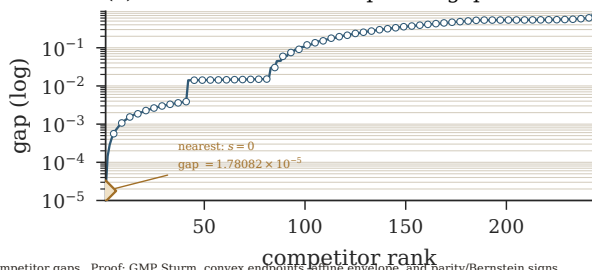

(a) Conservative $s = 162$ minus $s = 0$ root-box gap

(b) Strict incremental threshold gains

(c) All 243 root-box competitor gaps

Display: 126 exact rational switch samples, three exact inter-stage lower gains, and all 243 exact competitor gaps. Proof: GMP Sturm, convex endpoints, affine envelope, and parity/Bernstein signs.

Scope: fixed $\omega_s = c^*(1 + \lambda|s|)$ in the reduced canonical edge system. No global affine-family optimum and no three-dimensional Navier-Stokes regularity claim.

Source: R0.51 exact certificate · 26/26 checks · 243 competitors · monitored 127.2 s · no floating-point sign decision
