

(a) Certified radius ladder

(b) Bounds and controls at  $r^* = 59/500$ 

(c) Exact residual versus allowance

Degree separation gives  $Z_{80} = 0.992496 < 1$  although the old all-order full-space bound is  $1.953683 > 1$ .

The exact residual is  $2.12 \times 10^{-64}$  of its allowance. The sufficient inequality fails at the nearby probe 19/160.

The 62D low-block inverse is exactly inert on the certified tail; the degree-81 column scan is finite regression only.

This is a local analytic branch certificate, not a proof of three-dimensional Navier--Stokes regularity.

$r: 4/81 \rightarrow 16/243 \rightarrow 59/500$
