

R0.73A | hidden mean, transient envelope, and frozen projection screen

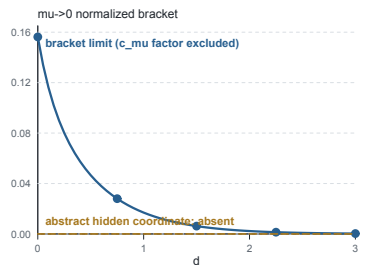

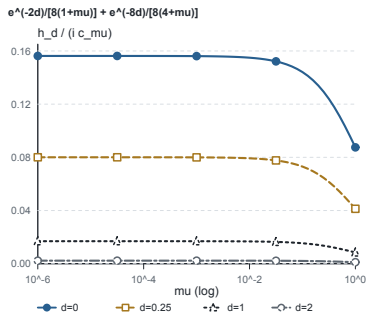

Exact formulas plus a validated finite Galerkin audit; no PDE simulation or fitted curve

A Normalized hidden-mean bracket

$h_d / (i c_\mu)$; path-sensitive interpretation

BRACKET $\mu \rightarrow 0$: NONZERO IF $c_\mu \rightarrow c0 \neq 0$

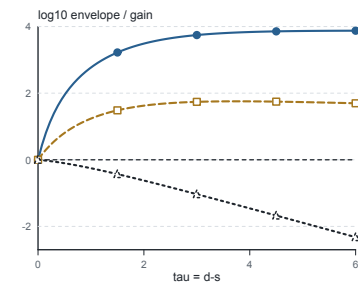

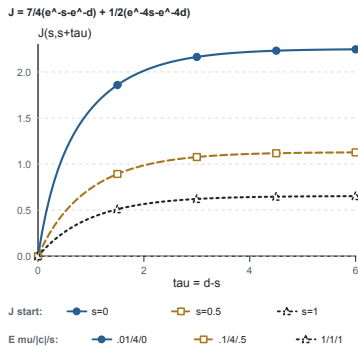

ABSTRACT TANGENT: NO HIDDEN COORDINATE
 FIXED $\Lambda_{\mu \rightarrow 0}$: UNDECIDED

Nonzero h_d limit requires $c_\mu \rightarrow c0 \neq 0$ ($\Lambda_{\mu \rightarrow 0} \sim 1/\gamma$).

B Transient envelope

Exact J kernel and declared analytic upper bounds

ANALYTIC UPPER ENVELOPE - NOT OBSERVED GAIN

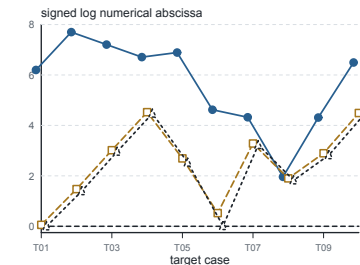

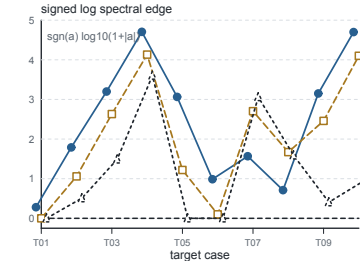

CERTIFIED X_μ GAIN: PENDING - NOT PLOTTED
 FORMAL SEAL BLOCKED; NO SYNTHETIC CURVE

Bound draft closed; maximum observed gain remains unclaimed.

C Frozen projection screen

Three matrix variants across ten low-gap target cases

FINITE GALERKIN $N=40$ - NOT INFINITE-DIMENSIONAL

— $\bullet$ unprojected
 - - $\square$ delete W_{0x}
 ... $\triangle$ delete $\sin x, \sin 2x$

FIXED PROJECTION SUFFICIENT: FALSE IN SCREEN
 NO GALERKIN TAIL BOUND

Counterexample screen only; not an infinite-dimensional theorem.
