

R0.42 canonical-stretch restart diagnostics

Exact GMP bounds; full degree and charge closure at $r^* = 329/1000$

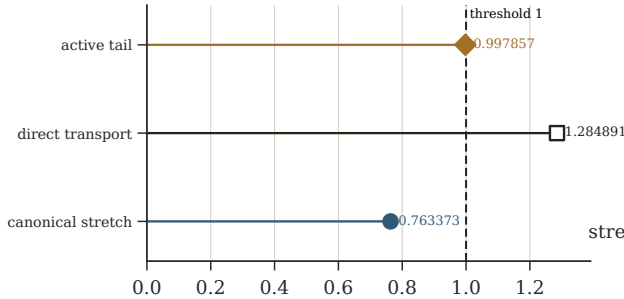

(a) Certified radius ladder

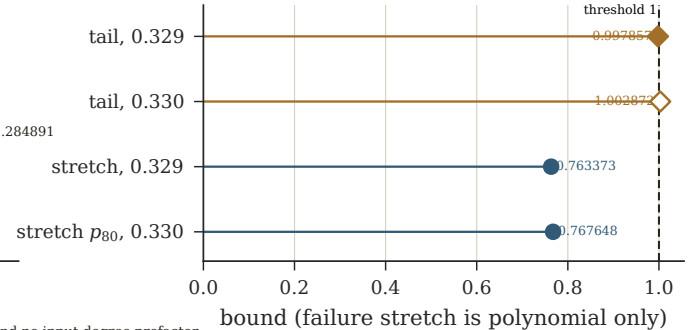

(b) Preassigned acceptance at $r = 0.282$

(c) Target gates at $r = 0.329$

(d) Millesimal active-tail bracket

Theorem: $S_a = \mathcal{L}^{-1}\{a, \cdot\}$ has exact convex endpoint columns and no input-degree prefactor.

Finite checks: 3055 monomial pairs; five complete columns; 990 canonical-factorization checks.

Boundary: $r = 0.330$ fails the present active-tail inequality only; no singularity is inferred.

Scope: reduced canonical edge generating system, not the full three-dimensional Navier-Stokes equation.
