

TWO-CARRIER SUPERPOSITION • VERIFIED MORSE GATE

The full $(R, 2R)$ profile closes the R0.720 ED hypothesis only inside a declared coefficient cone and affine row.

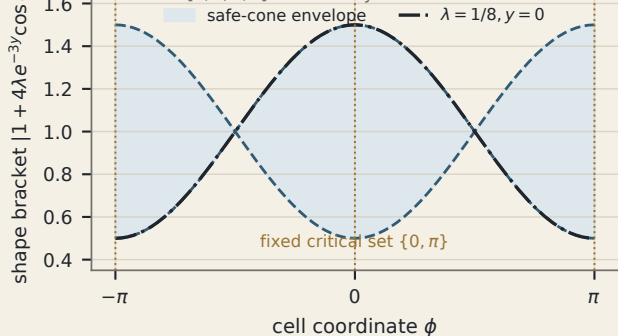

A Exact two-carrier cell reduction

paired $\pm$ shifts give factor 2; ϵ absorbs it

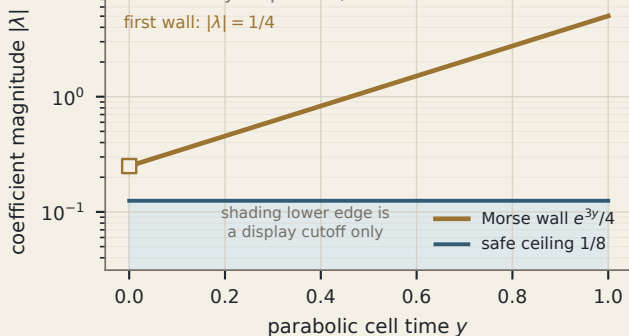

B Uniform shape bracket

bracket $\in [1/2, 3/2]$ leaves only the two sine zeros

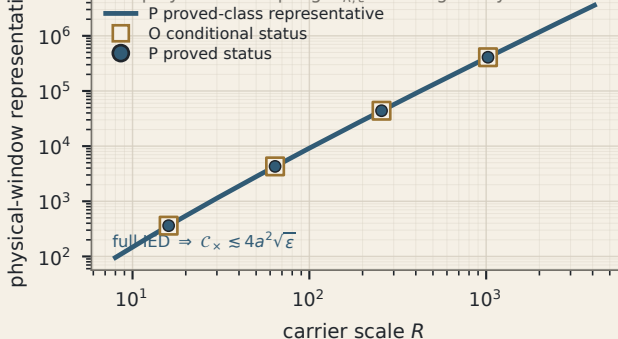

C Exact Morse wall

safe cone stays separated; the wall is not an ED counterexample

D Physical ledger proved in one class

fixed-polynomial coupling: $L_{R, \epsilon} \asymp 1 + \log R$ only

Blue/filled = proved in R0.72P; ochre/open = boundary or prior conditional status.

Panel D is a fixed-polynomial asymptotic representative; constants are suppressed and the exact ledger retains $L(R, \epsilon)$.
