

Viscous creation of positive signed packet work

two exact output packets · dimensionless time $\tau = \nu t$ · closed Stokes witness

EXACT HEAT-SEMIGROUP WITNESS / NOT A NAVIER-STOKES CONTINUATION OR REGULARITY RESULT

At $\tau = 0$: $W = E_{\text{root}} = 0$ but $E_{\text{fine}} = \delta = 1/2$. Unequal viscous decay reveals latent fine-ledger mass at the parent.

Scope: exact two-packet Stokes evolution and refinement identity; no Navier-Stokes time-integrability or continuation bound is proved.
