

Amplitude-doped complete-ledger test

$A_q = q^{5/2} \cdot \nu = .02 \cdot \text{target } (1, 1) \cdot d = 8 \cdot \text{roots } (.1, .2)/q^2 \cdot \text{background } B_q = A_q q$

A Certified atom-to-complete-ledger ratio

B Finite nonlinear coset scaling

C Root transversality and radius audit

Evidence boundary: analytic certificate in A; finite retained-coset ODE corroboration in B-C. Computation corroboration only - not DNS.

No continuum IFT or spectral-convergence proof is claimed; the initial-data norms are not uniformly bounded; source data are fully archived.
