

Heat-weighted periodic target through 24 four-bit cycles

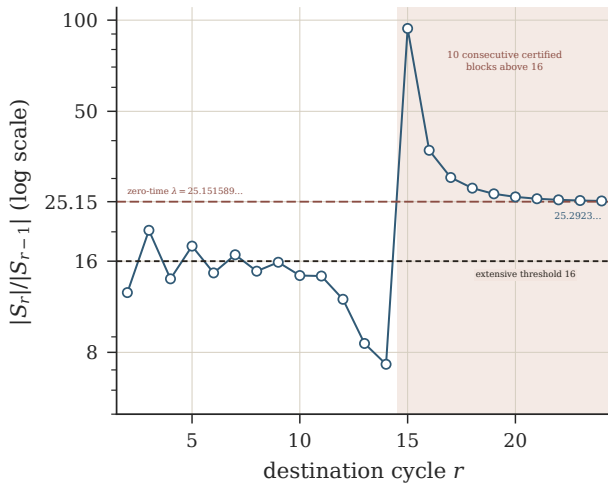

Exact bivariate moments to degree 96 · order-48 rational simplex enclosure · $L = 1, M = 16^r$

(a) Signed normalized quartic coefficient

(b) Absolute growth per four-level block

Finite inference boundary: every point is rigorously enclosed, but 24 scales do not prove an asymptotic limit or unbounded $|S_r|/M_r$.
