

Threshold radius across the multiplicative charge-character family

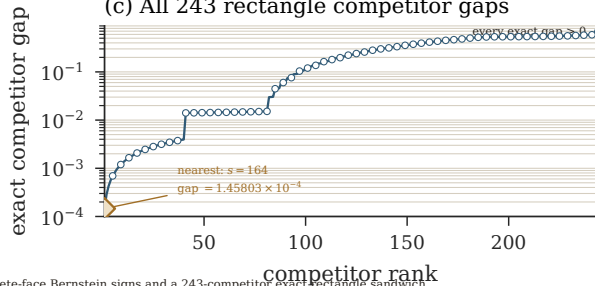

(a) Global profile of the active-column threshold $r_*(c)$

(b) Local gain relative to $c = 4/5$

(c) All 243 rectangle competitor gaps

Display curves: 90-digit evaluation of the exact degree-80 Laurent polynomial. Proof: four complete-face Bernstein signs and a 243-competitor exact-rectangle sandwich.

Scope: reduced canonical edge generating system; optimization only within the multiplicative family $\omega_s = c^s$. No three-dimensional Navier–Stokes regularity claim.

Source: R0.50 exact certificate · 33/33 checks · 243 competitors · monitored 138.1 s · no floating-point sign decision
