

R0.74S Step 14: outer-collar and jump-corona method boundary

ANALYTIC SCHEMATIC | EXACT FORMULAS | NOT SIMULATION OR DNS | OPEN PDE LEMMA | NOT CLAY

A Outer-collar coefficient alignment

Outer face

target γ_k / payment $\gamma_k = 1$
finite deletion leaves infinitely many

PROVED GEOMETRIC

Inner face ($k \geq 3$)

$\gamma_k / \gamma_{k-2} \rightarrow 0$
super-Gaussian gain only here

PROVED

Smooth aligned spikes

weighted L1 cannot imply L_p , $p > 1$

ABSTRACT ONLY

B Critical density threshold

First lambda-roots

$\sum \rho_Q \leq M_R / \lambda$
 $\sum p_Q \leq (2\lambda)^{1/2} M_R$

PROVED

Critical factorization

$m_Q = \rho_Q^{1/3} p_Q^{2/3}$
 λ cancels exactly

NO GAIN

$$(M_R / \lambda)^{1/3}$$

$$\times ((2\lambda)^{1/2} M_R)^{2/3}$$

$$= 2^{1/3} M_R$$

Changing lambda cannot improve

a linear total-measure payment

PROVED THRESHOLD

C Jump skeleton versus unpaid corona

$$\text{jump: } \sum c_{\text{child}}^3 \leq \theta c_S^3$$

$$\theta = 2^{(1-\alpha)/\kappa} < 1$$

LOW-TRANSITION CORONA

moving drift + unreached nodes
no quadratic q-budget yet

Critical eight-child corona

$8(1/2)^3 = 1$ repeats

ABSTRACT

$$S_{.375} \Rightarrow S_{.376}$$

PDE antecedent remains open

CONDITIONAL
