

R0.73R | phase concentration and shell scaling

Matched Dirichlet/Rudin-Shapiro tensors · exact support facts and analytic scaling laws · not simulation

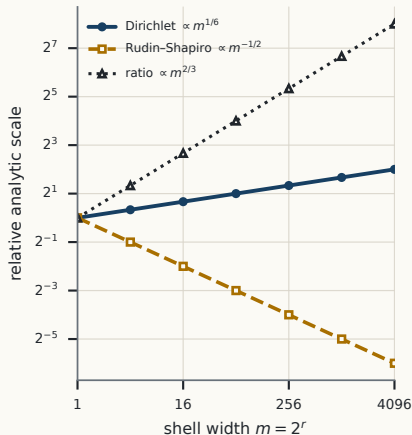

A Matched Fourier packets

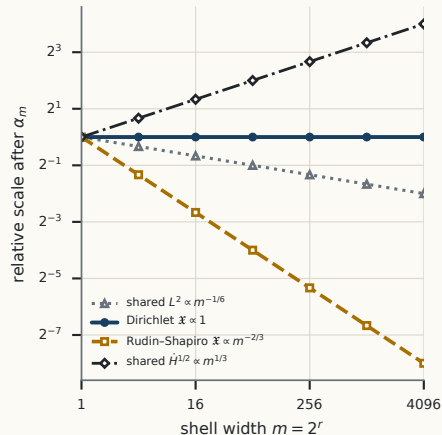

$m = 8, N = 64$; same sites and $|\widehat{W}| = 1/(\sqrt{2}m)$
positive packet shown · conjugate reflection omitted

B Unscaled analytic scaling

C Analytic scaling after α_m

Panels B-C are analytic exponent guides normalized at $m=1$; no fit, PDE solve, safety inference, or Clay conclusion.
