

Exact Leray polarization channels in high-high-to-low triads

(a) Channel profile at $|k|/|p| = 1/8$

Exact kernel: $\mathcal{K}_{p,q}(a,b) = g_N a_t [b_n n + (\hat{q} \cdot \hat{k}) b_t t_k]$; only the normal channel attains one.

Separated-cell theorem: if $|k|/|p| \leq \rho < 1$, then $g_T \leq (1 + \rho)/2 < 1$, whereas positive angular averages of g_N have no shell decay.

(b) Two exact integer families

(c) Angular persistence

Exact audit: 1,764,912 integer triads · 400,000 family instances · 21/21 checks · Craya-Herring/Waleffe frame acknowledged as prior art

Scope: pointwise triad lemma; no closed large-data norm and no three-dimensional Navier-Stokes regularity claim
