

R0.73Z | Covariance separation and endpoint obstruction

Closed-form normalized consequences; finite plotted rows are not proofs.

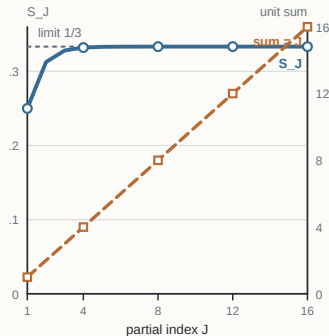

A Initial-endpoint frequency

$E/\pi^3 = 6$; plotted bound factor = n in $c \cdot n$

B Lacunary exact arithmetic

$S_J \rightarrow 1/3$, while each lower-bound unit equals 1

C Crossed production kernel

$A=B=n=1$; $x_1=x_2=\pi/3$; $r=\exp(-s)$
